

Important properties

Images, sounds, clips, other types of data have structure

• They can be stored as multi-dimensional arrays

• They feature axes for which deriving matters (e.g. width vs height, time

- One axis (the channel axis) can be used to access different views of the data (e.g. R/G/B color channels in an image, L/R of a stereo audio track)

Important properties

- Images, sound clips, other types of data have structure
- They can be stored as multi-dimensional arrays
- They feature axes for which ordering matters (e.g. width vs. height, time)
- One axis (the channel axis) can be used to access different views of the data (e.g. R/G/B color channels in an image, L/R of a stereo audio track)

Discrete convolution

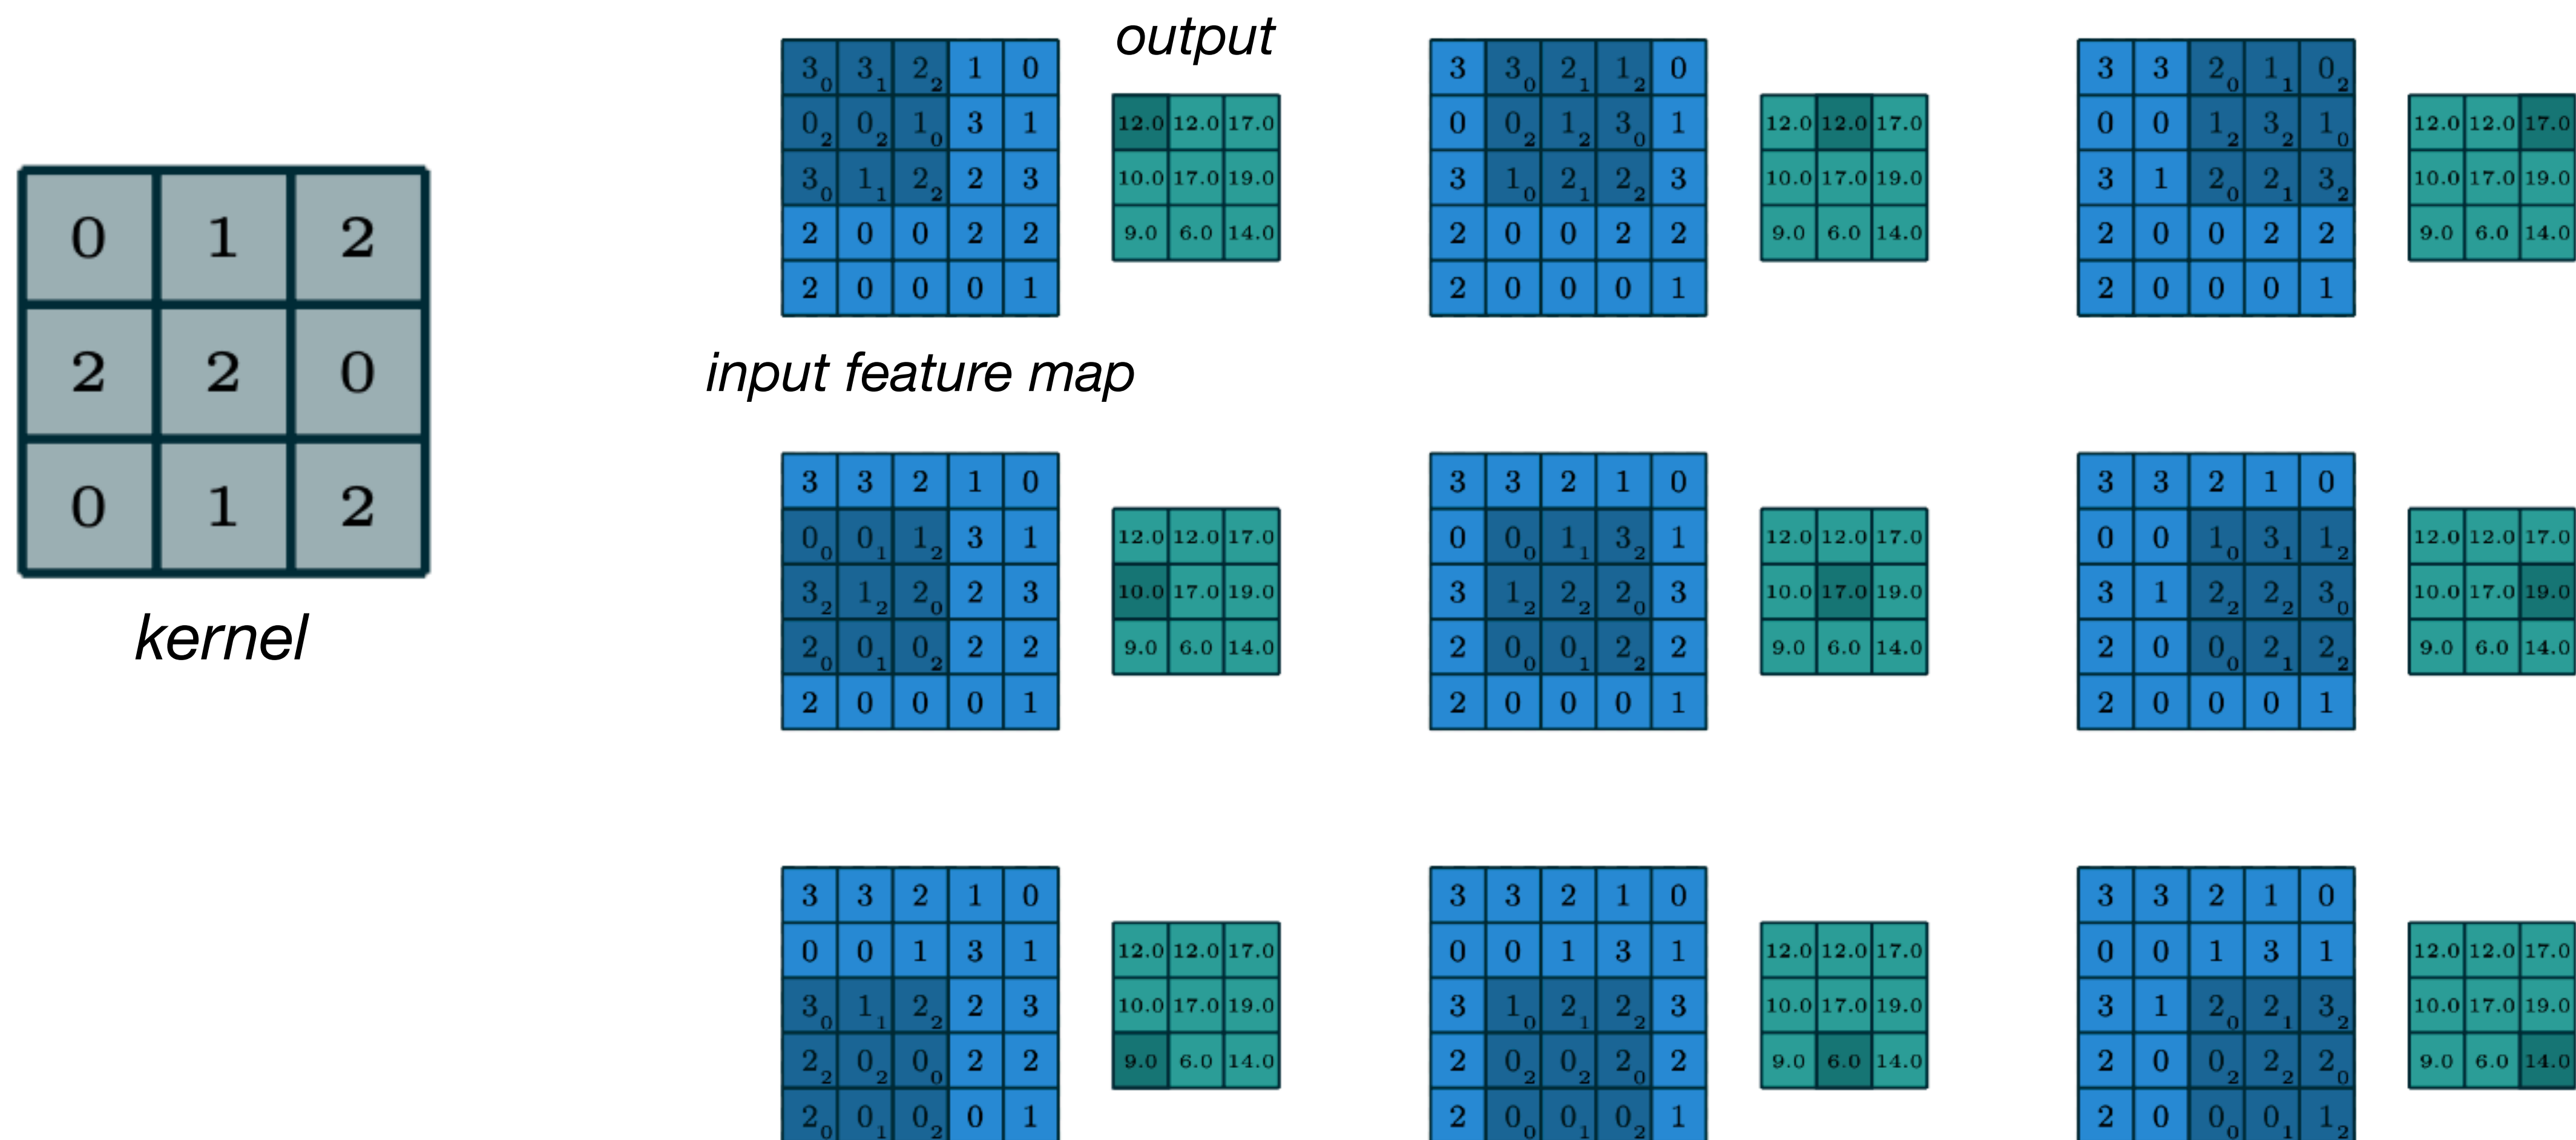

Figure 1.1: Computing the output values of a discrete convolution.
